Thailand PROMPTPAY API Specification

Version: 1.1

Description

This document introduces the **OpenAPI specification** which describes the REST APIs for HSBCs Collection of digital payments - Thailand PROMPTPAY QR Code.

The target audience of this document are Developers, Business Analysts and other Project Team Members.

Update Log

- [Jan 15, 2022] **v1.1** Revised several content sections
- [Aug 4, 2021] **v1.0** Initial Draft

How to Read this Document

First of all, get to know what features we can offer in [Features Overview](#) and then get the key idea of our API operations in [here](#). Before you connect to our API, remember to collect all prerequisites and go through all requirements in [How to Connect](#) section. So, let's get started!

Features Overview

Webhooks for Payment

Asynchronous callback will be pushed back to Merchant regarding to different payment events such as a captured payment or a settled payment. Please see [Webhooks](#) for details.

How to Connect

API Connectivity refers to all measures and their components that establishes connection between HSBC, the API Provider and Merchant, the API Consumer.

	Definition	Components
API Authentication	HTTP BASIC Authentication	<ul style="list-style-type: none">UsernamePassword
	Locate API Gateway Policy of the corresponding user	<ul style="list-style-type: none">Client IDClient Secret
User Identification	A Merchant Profile	<ul style="list-style-type: none">Merchant IDMerchant Profile
Connection Security	HTTPS Connection (TLS 1.2) and Network Whitelisting	<ul style="list-style-type: none">SSL CertificateNetwork Whitelist
Message Security	Digital Signing and Data Encryption	<ul style="list-style-type: none">A pair of Private Key & Public Key Certificate (PKI Model)JWS Key IDJWE Key ID

API Gateway URL

You need to include this before each API endpoint to make API calls.

Production

Message Security - Data Encryption and Signing

In addition to the Transport Layer Security, HSBC adopts additional security - Data Encryption on the message being passed across the session. This serves as a type of locked briefcase containing the data (the API message) within the HTTPS "tunnel". In other words, the communication has double protection.

!

DID YOU KNOW?

Javascript Object Signing and Encryption (JOSE™), is a framework that secures information transferred between parties. To achieve this, the JOSE framework provides a collection of specifications, including JSON Web Signature (JWS™) and JSON Web Encryption (JWE™).

HSBC uses [JWS](#) to sign message payloads, and [JWE](#) to encrypt the signed message. These are created by using the [Private Key & Public Key Certificate \(PKI Model\)](#).

Private Key & Public Key Certificate (PKI Model)			
Purpose	<ul style="list-style-type: none">Digitally sign a API request messageDecrypt a API response message		<ul style="list-style-type: none">Encrypt the signed API request messageVerify a signed API response message
Components	<ul style="list-style-type: none">Private Key issued by Merchant	<ul style="list-style-type: none">Public Key Certificate issued by HSBC	
Where to get it?	<ul style="list-style-type: none">Created by any Public Key Infrastructure (PKI) toolkits, such as Keytool™ and OpenSSL™. Technical detail is in here		<ul style="list-style-type: none">Exchanged with HSBC with the Public Key Certificate issued by Merchant
Implementation	Please see the technical detail in here		

!

NOTE:

Technically, an X.509 certificate can serve as a SSL Certificate as well as a Public Key Certificate for Data Encryption. However, for segregation of certificate usage, HSBC recommends that the Merchant uses a different X.509 Certificate for Data Encryption. Moreover, the Public Key Certificate does not have to be CA-signed. However, if the Merchant decides to enhance security, a CA-Signed Certificate is acceptable.

keyID of JWS™ & JWE™		
Purpose	<ul style="list-style-type: none">• The unique identifier to bind Merchant's Private Key in order to create a JWS object - a signed Message Payload	<ul style="list-style-type: none">• The unique identifier to bind HSBC's Public Key Certificate in order to create a JWE object - an encrypted JWS object
Components	<ul style="list-style-type: none">• keyID of JWS™	<ul style="list-style-type: none">• keyID of JWE™
Where to get it?	<ul style="list-style-type: none">• Mutual agreed between Merchant and HSBC	<ul style="list-style-type: none">• Mutual agreed between Merchant and HSBC
Implementation	Define in program coding, see demo in here

For security purposes, [HSBC's Public Key Certificate] and its associated [keyID] is renewed every year and a Certificate Renewal process is triggered. More detail is covered in the section [Key Renewal](#)

How to Sign and Encrypt Outgoing Message

Every message sent to HSBC must be signed and encrypted. From the Merchant's perspective, an **Outgoing Message** means:

- the Request Message of a Service API, or
- the Respond Message of a Callback API.

To help you understand how to construct a Signed and Encrypted Message, let's take the Java program below as an example. Don't worry if you are not familiar with Java, the idea is to let you know the steps and the required components:

NOTE: These Java codes are for demonstration only - it's not *plug and play*.

```
private JWSSigner signMessage(String messagePayload, KeyStore ks) throws UnrecoverableKeyException, KeyStoreException, NoSuchAlgorithmException {
    #1 Payload payload = new Payload(messagePayload);

    #2 JWSSigner header = new JWSSigner
        .Builder(JWSAlgorithm.RS256)
        .keyID("0001")
        .customParam("iat", Instant.now().getEpochSecond());
    #3 JWSSigner jwsObject = new JWSSigner(header, payload);

    #4 PrivateKey privateKey = (PrivateKey) ks.getKey(keyAlias, keyPassword);
    JWSSigner signer = new RSASSASigner(privateKey);
    #5 jwsObject.sign(signer);

    return jwsObject;
}
```

1. Prepare your **Message Payload**, that is, the plain `json` request message.

2. Create a **JWS Header** where the parameters are as follows:

```
{
  "alg": "RS256",           //Signing Algorithm is RS256
  "kid": "0001",           //Put your own Key ID value, "0001" is HSBC's keyID
  "iat": "1625587913"      //Issued At - the time this request is sent
}
```

3. Create a **JWS Object** by combining JWS Header and Message Payload.

4. Retrieve your **Private Key** as the signer.

5. Create a **Signed JWS Object** by signing it with the Private Key.

Next, **Encrypt** the Signed JWS Object:

```
private JWEObject getEncryptedJWEObject(JWSSigner jwsObject, RSAPublicKey publicKey) throws JOSEException {
    #1 Payload jwepayload = new Payload(jwsObject.serialize());

    #2 JWEHeader jweheader = new JWEHeader.Builder(JWEAlgorithm.RS256)
    #3 JWEObject jweObject = new JWEObject(jweheader, jwepayload);

    #4 JWEEncrypter encrypter = new RSAEncrypter(key);
    #5 jweObject.encrypt(encrypter);

    return jweObject;
}
```

1. Prepare your **JWE Payload**, that is, the `Signed JWS Object`.

2. Create the **JWE Header**. The algorithm used to encrypt the message body is `A128GCM` while the algorithm used to encrypt the encryption key is `RSA_OAEP_256`. **JWE keyID** is `0002`.

3. Create the **JWE Object** by combining JWE Header and JWE Payload.

4. Retrieve the **HSBC's Public Key** as the encrypter.

5. Create the **Encrypted JWE Object** by encrypting it with HSBC's Public Key.

You are now ready to put the Encrypted JWE Object in the message body (*you may need to first serialize it into String format, depends on your program code design*) of any API call.

How to Decrypt Message and Verify Signature of an Incoming Message

Every message sent from HSBC must be decrypted and verified. From the Merchant's perspective, an **Incoming Message** means:

- the Respond Message of a Service API, or
- the Request Message of a Callback API.

Key Renewal

Let's look into the following example to see how to decrypt a response message from HSBC:

```
private String decryptMessage(String respMsgPayload, KeyStore k
throws KeyStoreException, NoSuchAlgorithmException, Certifica
    java.text.ParseException, UnrecoverableKeyException, J
#1 JWEObjct jweObject = JWEObjct.parse(respMsgPayload);

#2 PrivateKey privateKey = (PrivateKey) keyStore.getPrivateKey

    JWEDecrypter decrypter = new RSADecrypter(privateKey);
#3 jweObject.decrypt(decrypter);

#4 String signedMessage = jweObject.getPayload().toString();
    return signedMessage;
}
```

1. Create an **Encrypted JWE Object** by parsing the encrypted response message payload.
2. Retrieve the **Private Key** as the decrypter.
3. Decrypt the JWE Object using your Private Key.
4. Get the **Signed Message** from the decrypted JWE Object.

You are now able to extract the plain `json` message, but first you **must** verify the signature to guarantee data integrity.

```
private String verifySignature(String signedMessage, KeyStore k
throws KeyStoreException, JOSEException, ParseException {
#1 JWSObject jwsObject = JWSObject.parse(signedMessage);

    Certificate certificate = ks.getCertificate(keyAlias);
#2 JWSVerifier verifier = new RSASSAVerifier((RSAPublicKey) ce

#3 if (!jwsObject.verify(verifier)) {
    throw new ValidationException("Invalid Signature");
}
#4 return jwsObject.getPayload().toString();
}
```

1. Create a **JWS Object** by parsing the `Signed Message`.
2. Retrieve the **HSBC's Public Key** as the verifier.
3. Verify the signed JWS Object. Invoke error handling if an invalid signature is found (*depends on your code design*).
4. Get the plain `json` message for further actions.

Summary

Components \ Steps	Message Signing	Message Encryption	Message Decryption	Verify Signature
JWS Object	Signing Algorithm: <code>RS256</code>			
JWE Object		JWE Algorithm: <code>RSA_OAEP_256</code> Encryption Method: <code>A128GCM</code>		
KeyID	<code>0002</code>	<code>0002</code>		
Merchant's Private Key	Used as <code>Signer</code>		Used as <code>Decrypter</code>	
HSBC's Public Key		Used as <code>Encrypter</code>		Used as <code>Verifier</code>

How to Make an API Request

An API request can be submitted without Message Encryption, in case you want to:

- learn about the basic API Call;
- test API connectivity before spending substantial development effort on Message Encryption.

Data encryption is a required data security imposed by HSBC standards. The Merchant has to invoke the encryption logic before moving to Production and must be fully tested during the testing phase.

Make Your API Request with Plain Messages

!

the Sandbox Environment you can skip message encryption.
However, this is for testing purpose only.

Submit an example API request using cURL™

cURL™ is a simple command-line tool that enables you to make any HTTP request. Merchant can choose any other GUI tool such as Postman™ and SoapUI™.

Step 1. Run this command on your platform:

POSTGET

```
#1 curl -X POST "https://devclustercmb.api.p2g.netd2.hsbc.co
#2 -H "message_encrypt: false"
#3 -H "Authorization: Basic eW91cl91c2VybmFtZTp5b3VyX3Bhc3
#4 -H "x-HSBC-client-id: 8b915a4f5b5047f091f210e2232b5ced"
#5 -H "x-HSBC-client-secret: 1bb456a541dc416dB6016B5F9583C
#6 -H "x-HSBC-msg-encrypt-id: 42298549900001+0001+0002"
#7 -H "Content-Type: application/json"
#8 -d "{ \"txnRef\": \"PAY-QJZV956664\", \"merId\": \"4229
```

1. Submit the POST request to the API URL endpoint.

2. Set the secret header message_encrypt: false to indicate this API request is without message encryption. This header is only applicable in Sandbox environment.

3. Put the Basic Authorization in HTTP header Authorization .

4. Put the Client ID in HTTP header x-HSBC-client-id .

5. Put the Client Secret in HTTP header x-HSBC-client-secret .

6. Put the Merchant ID, the JWS ID and the JWE ID in HTTP header x-HSBC-msg-encrypt-id respectively.

7. Set the Content-Type to JSON format.

8. Plain json message payload.

```
#1 curl -X GET "https://devclustercmb.api.p2g.netd2.hsbc.co
#2 -H "message_encrypt: false"
#3 -H "Authorization: Basic eW91cl91c2VybmFtZTp5b3VyX3Bhc3
#4 -H "x-HSBC-client-id: 8b915a4f5b5047f091f210e2232b5ced"
#5 -H "x-HSBC-client-secret: 1bb456a541dc416dB6016B5F9583C
#6 -H "x-HSBC-msg-encrypt-id: 42298549900001+0001+0002"
#7 -H "Content-Type: application/json"
```

1. Submit the GET request to the API URL endpoint.

2. Set the secret header message_encrypt: false to indicate this API request is without message encryption. This header is only applicable in Sandbox environment.

3. Put the Basic Authorization in HTTP header Authorization .

4. Put the Client ID in HTTP header x-HSBC-client-id .

5. Put the Client Secret in HTTP header x-HSBC-client-secret .

6. Put the Merchant ID, the JWS ID and the JWE ID in HTTP header x-HSBC-msg-encrypt-id respectively.

7. Set Content-Type to JSON format.

Step 2. Receive the response message in plain json format.

Making API Request with Message Encryption

Step 1. Run this cURL™ command on your platform:

POSTGET

```
#1 curl -X POST "https://devclustercmb.api.p2g.netd2.hsbc.co
#2 -H "Authorization: Basic eW91cl91c2VybmFtZTp5b3VyX3Bhc3
#3 -H "x-HSBC-client-id: 8b915a4f5b5047f091f210e2232b5ced"
#4 -H "x-HSBC-client-secret: 1bb456a541dc416dB6016B5F9583C
#5 -H "x-HSBC-msg-encrypt-id: 42298549900001+0001+0002"
#6 -H "Content-Type: application/json"
#7 -d "eyJraWQ1OiIwMDAxIiwiaWZwSjIjoIjQTEyOEdDTSIsImFsZyI6IlJ
```

1. Submit the POST request to the API URL endpoint. Any {id} adhered in the URL must be encrypted.

2. Put the Basic Authorization in HTTP header Authorization .

3. Put the Client ID in HTTP header x-HSBC-client-id .

4. Put the Client Secret in HTTP header x-HSBC-client-secret .

5. Put the Merchant ID, the JWS ID and the JWE ID in HTTP header x-HSBC-msg-encrypt-id respectively.

6. Set the Content-Type to JSON format.

7. The Encrypted Message Payload.

```
#1 curl -X GET "https://devclustercmb.api.p2g.netd2.hsbc.co
#2 -H "Authorization: Basic eW91cl91c2VybmFtZTp5b3VyX3Bhc3
#3 -H "x-HSBC-client-id: 8b915a4f5b5047f091f210e2232b5ced"
#4 -H "x-HSBC-client-secret: 1bb456a541dc416dB6016B5F9583C
```

```
#5 -H "x-HSBC-msg-encrypt-id: 42298549900001+0001+0002"
#6 -H "Content-Type: application/json"
```

1. Submit the `GET` request to the API URL endpoint. Any `{id}` adhered in the URL must be encrypted.
2. Put the [Basic Authorization](#) in HTTP header `Authorization`.
3. Put the [Client ID](#) in HTTP header `x-HSBC-client-id`.
4. Put the [Client Secret](#) in HTTP header `x-HSBC-client-secret`.
5. Put the [Merchant ID](#), the [JWS ID](#) and the [JWE ID](#) in HTTP header `x-HSBC-msg-encrypt-id` respectively.
6. Set the `Content-Type` to JSON format.

NOTE:

Data Encryption invokes compulsory prerequisites, such as [JOSE library](#) and program coding, please make sure the section on [Message Security](#) has been gone through thoroughly.

Step 2. For a successful request (HTTP Status Code 200), an encrypted response message is returned, otherwise, a plain `json` with failure message is returned.

Data Type Overview

Data Type Control:

Data Type	Allowed Characters	Definition & Important Notice
String (For general field)	Alphanumeric and Symbols	General field means field which is NOT a critical field. HSBC system will execute characters checking upon all string fields we received in order to tackle security vulnerability, such as Cross-site Scripting. Yet, we recommend you to try use Alphanumeric only for most cases.
String (For critical field)	<div>0-9a-zA-Z-.</div>	<p>Critical field is used to be either a key or search criteria in HSBC backend system and hence tight restriction is applied to the allowed characters.</p> <p>Moreover, the starting and ending space of the string value will be trimmed before stored in HSBC system. For example, string <code>" example 12 34 "</code> will be trimmed to <code>"example 12 34"</code>.</p> <p>List of Critical Fields:</p> <p>All <code>id</code> (s)</p>
Integer	0-9	Instead of having Max Length check for String, integer range will be checked, e.g. <code>0 ≤ x ≤ 9999</code>

Field Mandatory Control:

Field Mandatory Type	Definition & Important Notice
Mandatory	Annotated with <code>required</code> tag in field definition section. Field & value must be present in the request with valid <code>JSON</code> format.
Optional	Annotated with <code>optional</code> tag in field definition section. If you don't want to pass fields that are optional, your handler should not pass neither empty strings <code>{"example":""}</code> nor blank value <code>{"example": " "}</code> .
Conditional	Annotated with <code>conditional</code> tag in field definition section. Required under a specific condition whose logic is always provided in the field definition if it is a Conditional Field.

Time Zone Control:

Aspect	Format	Definition & Important Notice
In Request Message	<code>yyyy-MM-dd'T'HH:mm:ssZ</code>	Time zone is expected to be <code>GMT+8</code> (Malaysia standard time). Merchant is required to perform any necessary time zone conversion before submit request if needed.
In Response Message	<code>yyyy-MM-dd'T'HH:mm:ss±hh:mm</code>	<p>Timezone returned in <code>api_gw</code> object is generated from HSBC API Gateway which located in Cloud and hence is calculated in <code>GMT+0</code>.</p> <p>On the other hand, time field in <code>response</code> object will be returned together with timezone information. For more details, please read each field definition carefully.</p>

FAQ

SSL Connection Questions

Where can I find the HSBC SSL server certificates?

The Merchant developer can export SSL server certificates installed in your browser. To achieve this, visit the domain of the corresponding API endpoint in your browser. For example, to get the SSL certificate of sandbox environment, use the domain name **https://devcluster.api.p2g.netd2.HSBC.com.hk/**

However, in production, we provide a certificate and require TLS 1.2 implementation.

Message Encryption Questions

What certificates do I need to work with Message Encryption in HSBC's sandbox and production environments?

A self-sign certificate is acceptable. However, if the Merchant decides to enhance security, a CA-Signed Certificate is also acceptable.

Javascript Object Signing and Encryption (JOSE) Framework Questions

Where can I get more information about JOSE Framework?

If you want to fully understand the framework, you can read [here](#) for more details.

Please note these urls or websites do not belong to HSBC, use them at your own discretion. By clicking these urls or websites signifies you accept these terms and conditions.

Where can I download JOSE libraries for development?

For your reference, you may find the following JOSE libraries of different programming languages.

- [Ruby](#)
- [Python](#)
- [PHP](#)
- [Java](#)
- [Node](#)
- [.NET](#)

Please note these urls or websites do not belong to HSBC, use them at your own discretion. By clicking these urls or websites signifies you accept these terms and conditions.

Webhooks

What is a Webhook

Webhooks (Web Callback, HTTP Push API or Reverse API) is one way one web application can send information to another application in real-time when a specific event happens.

You can use HSBC Omni Collect Webhooks to receive notifications when a specific event occurs. When one of these events is triggered, we send an HTTP POST payload in encrypted JSON to the webhook's configured URL.

Set Up

Entity	Event	URL Set Up
Payments	<ul style="list-style-type: none">• payment.success• payment.settled	Contact our support team for configuration

DISCLAIMER

- Disclaimer

Every event that receives a non-2xx response is considered as an event delivery failure and retry mechanism will be triggered. Up to 4 retries will be triggered in every 2 minutes. Maximum 5 calls including the 1st attempt.

Idempotency

There could be scenarios where your endpoint might receive the same webhook multiple times. This could happen as an expected behaviour such as the retry mechanism or any other exceptional behaviour such as network problem.

To handle duplicate webhooks, we offer a unique webhook ID `x-hsbc-webhook-id` where you can find it in the HTTP header on every webhook.

Webhooks

Webhooks for Payments

POST /<Callback URL predefined by Merchant>

DESCRIPTION

The table below lists the Webhook events available for payments.

Webhook Event	Definition
payment.success	Triggered when a payment is successfully captured.
payment.settled	Triggered when a payment is settled.

REQUEST PARAMETERS

x-hsbc-webhook-id <div>required</div> <div>in header</div>	UUID
Content-Type: string <div>required</div> <div>in header</div>	text/plain

REQUEST BODY

[PaymentWebhook](#) *Data Encryption is enforced. API Schema intends to demonstrate the skeleton of the message payload only.*

RESPONSES

200 OK
[Callback](#) *Data Encryption is enforced. API Schema intends to demonstrate the skeleton of the message payload only.*

Schema Definitions

PaymentWebhook: object

PROPERTIES

webhook: object

required

PROPERTIES

event: string enum: [payment.success, payment.settled] range: (up to 100 chars)

required

Event Type

entities: string[]

required

The list of Entities contained in this Webhook

Request Content-Types: text/plain

Request Example

```
{
  "webhook": {
    "event": "payment.success",
    "entities": [
      "payment"
    ]
  },
  "payload": {
    "payment": {
      "id": "14627849160897986",
      "sqn": "14627849160897986",
      "merchant_id": "T014570T8290000",
      "master_merchant_id": null,
      "amount": 1000,
      "currency": "THB",
      "payer_bank_code": "003",
      "status": "SUCCESS",
      "txn_datetime": "2020-01-01T13:02:00+07:00",
      "notify_datetime": "2020-01-01T13:02:00+07:00",
      "value_date": "2020-01-01",
      "type": "CREDIT_TRANSFER",
      "credit_account": "*****570001",
      "proxy": {
        "id": "*****642001",
        "type": "ANY_ID"
      },
      "channel": "MOBILE",
      "terminal_id": null,
      "ref1": null,
      "ref2": null,
      "ref3": null
    }
  }
}
```

Response Content-Types: application/json

Response Example (200 OK)

```
{
  "status": "SUCCESS"
}
```

Example

```
{
  "webhook": {
    "event": "payment.success",
    "entities": [
      "payment"
    ]
  },
  "payload": {
    "payment": {
      ...See schema Payment for details...
    }
  }
}
```

Lifecycle of Cryptographic Keys

This section highlights the Lifecycle of cryptographic keys in the following stages:

1. Generate keys pair (Private Key and Public Key Certificate)
2. **Optional:** Export CSR (Certificate Signing Request) and sign using a CA (Certificate Authority)

! DID YOU KNOW?
In public key infrastructure (PKI) systems, a certificate signing request is a message sent from an applicant to a certificate authority in order to apply for a digital identity certificate. It usually contains the public key for which the certificate should be issued.

3. Exchange Certificate with HSBC
4. Certificate and Keys Maintenance
5. Certificate and Keys Renewal Process

The Key Renewal Process Command line tool **Java Keytool™** is used in the demonstration. The tool can generate public key / private key pairs and store them into a Java KeyStore. The Keytool executable is distributed with the **Java SDK (or JRE)™**, so if you have an SDK installed you will also have the Keytool executable. The Merchant is free to choose any other tool to generate and manage keys, such as **OpenSSL™**.

Key Generation and Certificate Exchange with HSBC

1. Create a new keys pair (Private Key and Public Key Certificate) with a new or existing Keystore.

```
keytool -genkey
        -alias merchant_key_pair
        -keyalg RSA
        -keystore merchant_keystore.jks
        -keysize 2048
        -validity 3650
        -storepass <your keystore password>
```

- **-genkey** - command to generate keys pair.
- **-alias** - define the alias name (or unique identifier) of the keys pair stored inside the keystore.
- **-keyalg** - key algorithm, it must be `RSA` regarding to HSBC standard. If `RSA` is taken, the default hashing algorithm will be `SHA-256`.
- **-keystore** - file name of the keystore. If the file already exists in your system location, the key will be created inside your existing keystore, otherwise, a new keystore with the defined name will be created.

! DID YOU KNOW?
Keystore is a password-protected repository of keys and certificates. A file with extension `.jks` means it is a Java Keystore which is originally supported and executable with Java™.

There are several keystore formats in the industry like `PKCS12` with file extension `.p12` which is executable with Microsoft Windows™, merchant can always pick the one most fit their application.

- **-keysize** - key size, it must be `2048` regarding to HSBC standard.
- **-validity** - the validity period of the private key and its associated certificate. The unit is `day`, 3650 means 10 years.
- **-storepass** - password of the keystore.

- 1.1. Provide the `Distinguished Name` information after running the command:

```
Information required for CSR generation
-----
What is your first and last name?
[Unknown]:  MERCHANT INFO
What is the name of your organizational unit?
[Unknown]:  MERCHANT INFO
What is the name of your organization?
[Unknown]:  MERCHANT INFO
What is the name of your City or Locality?
[Unknown]:  HK
What is the name of your State or Province?
[Unknown]:  HK
What is the two-letter country code for this unit?
[Unknown]:  HK
Is CN=XXX, OU=XXX, O=XXX, L=HK, ST=HK, C=HK correct? (type "y"
[no]:  yes
```

```
{
  "status": "SUCCESS"
}
```

```
Enter key password for <merchant_key_pair>
(RETURN if same as keystore password):
Re-enter new password:
```

NOTE:
The Private Key password and Keystore password can be identical, however to be more secure, the Merchant should set them differently.

2. **Optional:** Export CSR and get signed with CA. This step can be skipped if the Merchant decides to work with a Self-Signed Certificate.

```
keytool -certreq
        -alias merchant_key_pair
        -keyalg RSA
        -file merchant_csr.csr
        -keystore merchant_keystore.jks
```

- **-certreq** - command to generate and export CSR.
- **-alias** - the name of the associated keys pair.
- **-keyalg** - key algorithm, it must be `RSA` regarding to HSBC standard.
- **-file** - file name of the CSR. This will be generated at the location where the command is run.
- **-keystore** - specify the keystore which you are working on.

2.1. Select and purchase a plan at Certificate Authority and then submit the CSR accordingly. After a signed Certificate is issued by CA, import the Certificate back to the Merchant's keystore.

```
keytool -import
        -alias merchant_signed_cert_0001
        -trustcacerts -file CA_signed_cert.p7b
        -keystore merchant_keystore.jks
```

- **-import** - command to import object into a specific keystore.
- **-alias** - define the alias name (or unique identifier) of the signed Certificate.
- **-trustcacerts -file** - specify the file name of the signed Certificate in Merchant's local file system.

NOTE:
`PKCS#7` is one of the common formats that contains certificates and has a file extension of `.p7b` or `.p7c`. The certificate format may be varied depending on the policy of the issuing CA.

- **-keystore** - specify the keystore which you are working on.

3. Export the Certificate and send it to HSBC for key exchange.

DID YOU KNOW:
A Certificate or Public Key Certificate is an electronic document that contains a public key and additional information that prove the ownership and maintains integrity of the public key. It is essential for the sender to ensure the key is not altered by any chance during delivery.

```
keytool -export
        -alias merchant_key_pair
        -file merchant_cert_0001.cer
        -keystore merchant_keystore.jks
```

- **-export** - command to export object from a specific keystore.
- **-alias** - the name of the associated keys pair.

NOTE:
If the Merchant associates the original keys pair `merchant_key_pair`, the exported Certificate is without CA-signed, and hence, Self-Signed. However, if the Merchant associates the imported Certificate `merchant_signed_cert_0001` mentioned in step #2, the exported Certificate is CA-signed.

- **-file** - specify the file name of the Certificate where the file will be exported to Merchant's local file system.

NOTE:
The default Certificate file encoding is binary. HSBC accepts both binary and base64 encoding. To export a printable base64 encoding file, please attach an extra parameter `-rfc` in the command.
e.g. `-file merchant_cert_0001.crt -rfc`.

- **-keystore** - specify the keystore which you are working on.

4. Import HSBC's Certificate into the merchant's Keystore.

```
keytool -import
        -alias hsb_cert_0002
        -file hsb_cert_0002.cer
        -keystore merchant_keystore.jks
```

- **-import** - command to import object into a specific keystore.
- **-alias** - define the alias name of HSBC's Certificate in your keystore.
- **-file** - specify the file name of HSBC's Certificate in Merchant's local file system.
- **-keystore** - specify the keystore which you are working on.

5. **Optional:** List keystore objects. Merchant is suggested to verify that all required objects are properly maintained. 2 - 3 entries should be found in your Java Keystore: *(Entries may be varied if other key repository format is used)*

Alias name	Corresponding Object	Remark
		These tw objects appear to be one entry in a JAVA Keystore. Merchant can still export them separatel into two objects (files) on your loca file syste dependin on your applicatio design.
merchant_key_pair	<ul style="list-style-type: none">• Merchant's Private Key• Merchant's Public Certificate (Self-Signed)	
merchant_signed_cert_0001	<ul style="list-style-type: none">• Merchant's Public Certificate (CA-Signed)	Not exist Merchant skips step #2
hsbc_cert_0002	<ul style="list-style-type: none">• HSBC's Public Certificate	

```
keytool -list -v -keystore merchant_keystore.jks

Keystore type: JKS
Keystore provider: SUN

Your keystore contains 3 entries

Alias name: merchant_key_pair
Creation date: Jan 1, 2020

DISCLAIMER

Disclaimer

Component	Storage	Validity
Merchant's Private Key	<p>Private Key should be maintained and handled with the most secure approach that a Merchant can apply. The most common and yet secure enough approach is:</p> <ul style="list-style-type: none">• key password - Do not save the password in plain text or hard-coded in application. Recommend to encrypt it by any Password Encryption Tools• key storage - Store inside password-protected key repository, such as <code>JKS</code> or <code>PKCS12</code> keystore. Keystore password should also be encrypted.	<p>No restriction on the Validity Period. However, if Merchant suspects there is any chance that the key is leaked or for any other security reason, a new Private Key and its associated Public Key Certificate should be generated.</p>
Merchant's Public Key Certificate	<p>Since Public Key Certificate is publicly distributed, a comparative moderate secure storage approach is acceptable. Merchant can store the physical file in any system's file system or store all keys and certificates in one single key repository for a centralised key management.</p>	<p>For a self-signed Certificate, the same condition has been mentioned as above.</p> <p>However, the validity period of a CA-signed Certificate is depended on the purchase plan of the issuing CA. The most common standard is 1 to 2 years.</p>
HSBC's Public Key Certificate	<p>Same as the above</p>	<p>1 Year</p> <p>NOTE: Technically, the validity period is usually 1 Year plus 1 to 2 months more. The spare period is a buffer for a merchant to switch a "to-be-expired" Certificate to the new one during the Certificate Renewal Process. More technical detail will be covered in later section.</p>

Certificates and Keys Renewal

Every Public Key Certificate has an expiration date. When either the Merchant's or HSBC's Certificate is about to expire, a key renewal process takes place. Please see the Key Renewal Process Flow below:

!

SOME RULES YOU SHOULD KNOW:

- **Keys Repository:** This is a mock-up for demonstration purpose only.
- **Keys Name:** Using a `Key Name` `KeyID` naming convention makes for a simpler demonstration. The suggested identifier of one key should be the alias name inside a key repository.
- **KeyID Value:** HSBC uses the naming convention `0001`, `0002`, `0003` ... `n + 1`, each time the HSBC certificate is renewed, the `KeyID` value is `n + 1`.
- **KeyID Binding:** The binding between the `KeyID` and the corresponding `Keys Pair` in the merchant's system can make use of any key/value logic, such as a Database table. In our example below, `KeyID 000X` binds to `Private Key v.000X` and `Public Certificate v.000X`, etc.
- **Validity Date:** All dates are made-up for demonstration purposes only.
